

BEDSOFT

SOURCE MATERIAL

Rape straw, wheat straw and/or woodchip - dependant on product.

MANUFACTURING PROCESS

First the straw is chopped, and then it passes into a second machine where it is beaten to open the stalk and expose the inner core. The inner of the stalk is the absorbent part of the straw. The bedding then goes through our superior dust extraction process before the BedSoft treatment is added, which features anti-viral, antibacterial and insect repellent properties. The treatment leaves a bitter taste on the bedding to discourage bed eating and the whole process is non-toxic leaving the bed with a welcoming lemon fragrance.

ECO-FRIENDLY?

Yes. All of the BedSoft range is produced to be biodegradable and the majority of the straw is produced from our own farms, which helps keep our carbon footprint to a minimum.

ABSORBENCY

The absorbency level of BedSoft is very high; because of the way we expose the inner core of the stalk. Rape straw, which we use in BedSoft Bio and BedSoft BioPlus will absorb 250% of its own weight in water.

DISPOSABILITY

BedSoft is very easy to dispose of because it is totally biodegradable, therefore easier and usually less expensive to be removed. It also can be spread on fields as it rots down so quickly, and the muckheap should be smaller in the first place as there is less waste!

COST

RRP £6.00 - £7.80 dependant on product.
